Penelopes Retaken

Penelopes retaken may be a small book of mine, it will treat about my http://www.tonyalmighty.software/ website!

This project is entirely made with PHP 5.6 and MYSQL, so, maybe someone may find obsolete, however it is a good prictice falling backwards sometimes! However, lates bits of PHP/MYSQL code work perfectly within older techniques.

<mark>The only way to find the truth absolute is in the search and change of the past rather than worring about the future!</mark>
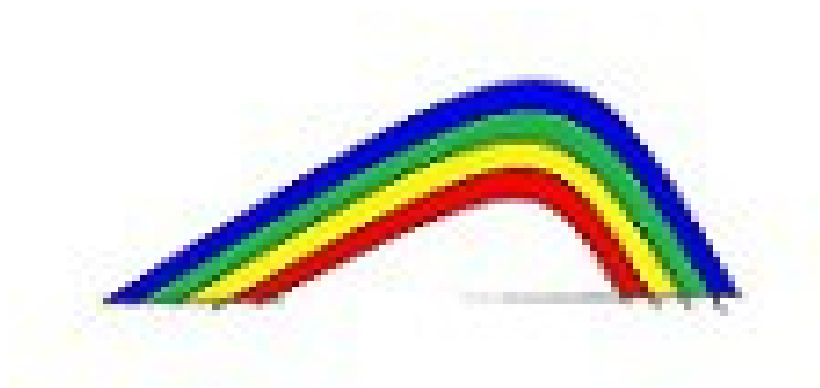

The program consists in my latest Zend Style website Design, all the files and folders (files folder only because Avatar is an automation of mine!) in Penelopes Retaken are contained, in this case infinityfree.net Webserver, in htdocs main folder or where either index than error trapping are redirected, Anyway in localhost the project is designed and developed in separated folders within C:\xampp\htdocs\ so, maybe you need to change some bits of path within my code!
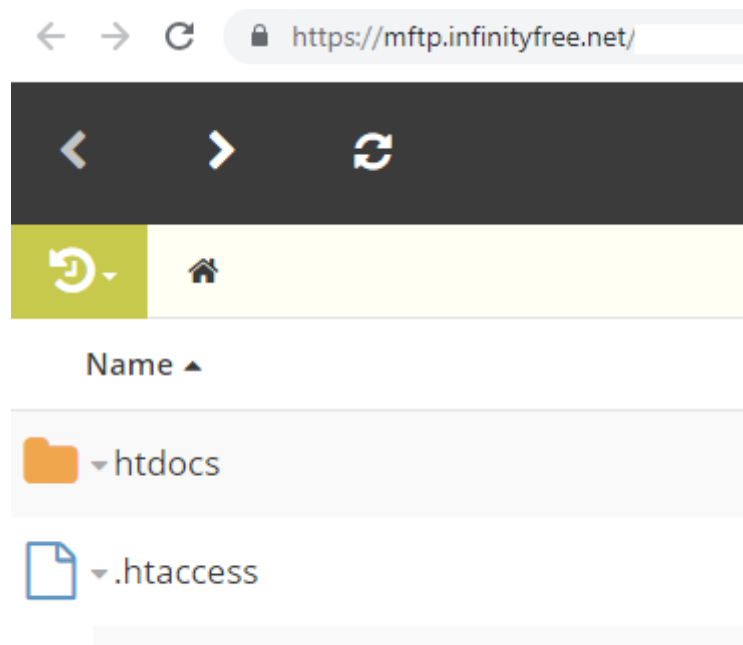

So, the path is simple cause Penelope Retaken is the FTP Filezilla download of infinityfree.net htdocs folder, which I renamed in Penelopes Retaken because build from the scratch of eva9000.com website Project, except Deadbunny Project whose I prefered CSS3 HTML5 design. Anyway, since some restriction by my webserver my

video project is still open to future changes, but according you modify the php.ini file MAX_UPLOAD, the program works perfectly and let the user upload very big size video files such as 700 MB or more.

Enjoy!
